

# (5%) M1: Hello, IMU!

## Objective

- Get started with programming your Arduino Nano 33 IoT and gain access to the IMU data
- IMU = accelerometer + gyroscope

## Requirements

- Design and construct a simple functional circuit that flashes an LED to display the Morse code version of "HELLO IMU"
- Write a program to log and display IMU data (all six axes) on the Serial Monitor
  - Each line of output needs to be the latest IMU readings (e.g., ax, ay, az, gx, gy, gz)
- Note that these can be SEPARATE programs
  - The morse code and IMU readings do not need to be displayed simultaneously

## Resources

- [Arduino IDE](#)

- Morse code
- Arduino accelerometer (Nano RP2040 Connect)

## Deliverable

- Demo the two programs to a classmate, who will submit a peer-grading form
- No partial grade—you need to complete both programs to obtain full credit
